# Distributed Ray Tracing

- Computes average radiance [Cook et al. 84]

# Distributed Ray Tracing

- Computes average radiance [Cook et al. 84]
  - Depth-of-field - visible region through lens
  - Motion blur - time
  - Anti-aliasing - pixel footprint
  - Glossy reflections - hemisphere

# Stochastic Progressive Photon Mapping

First robust algorithm for computing *all* types of light transport with distributed ray tracing effects

# Stochastic Progressive Photon Mapping

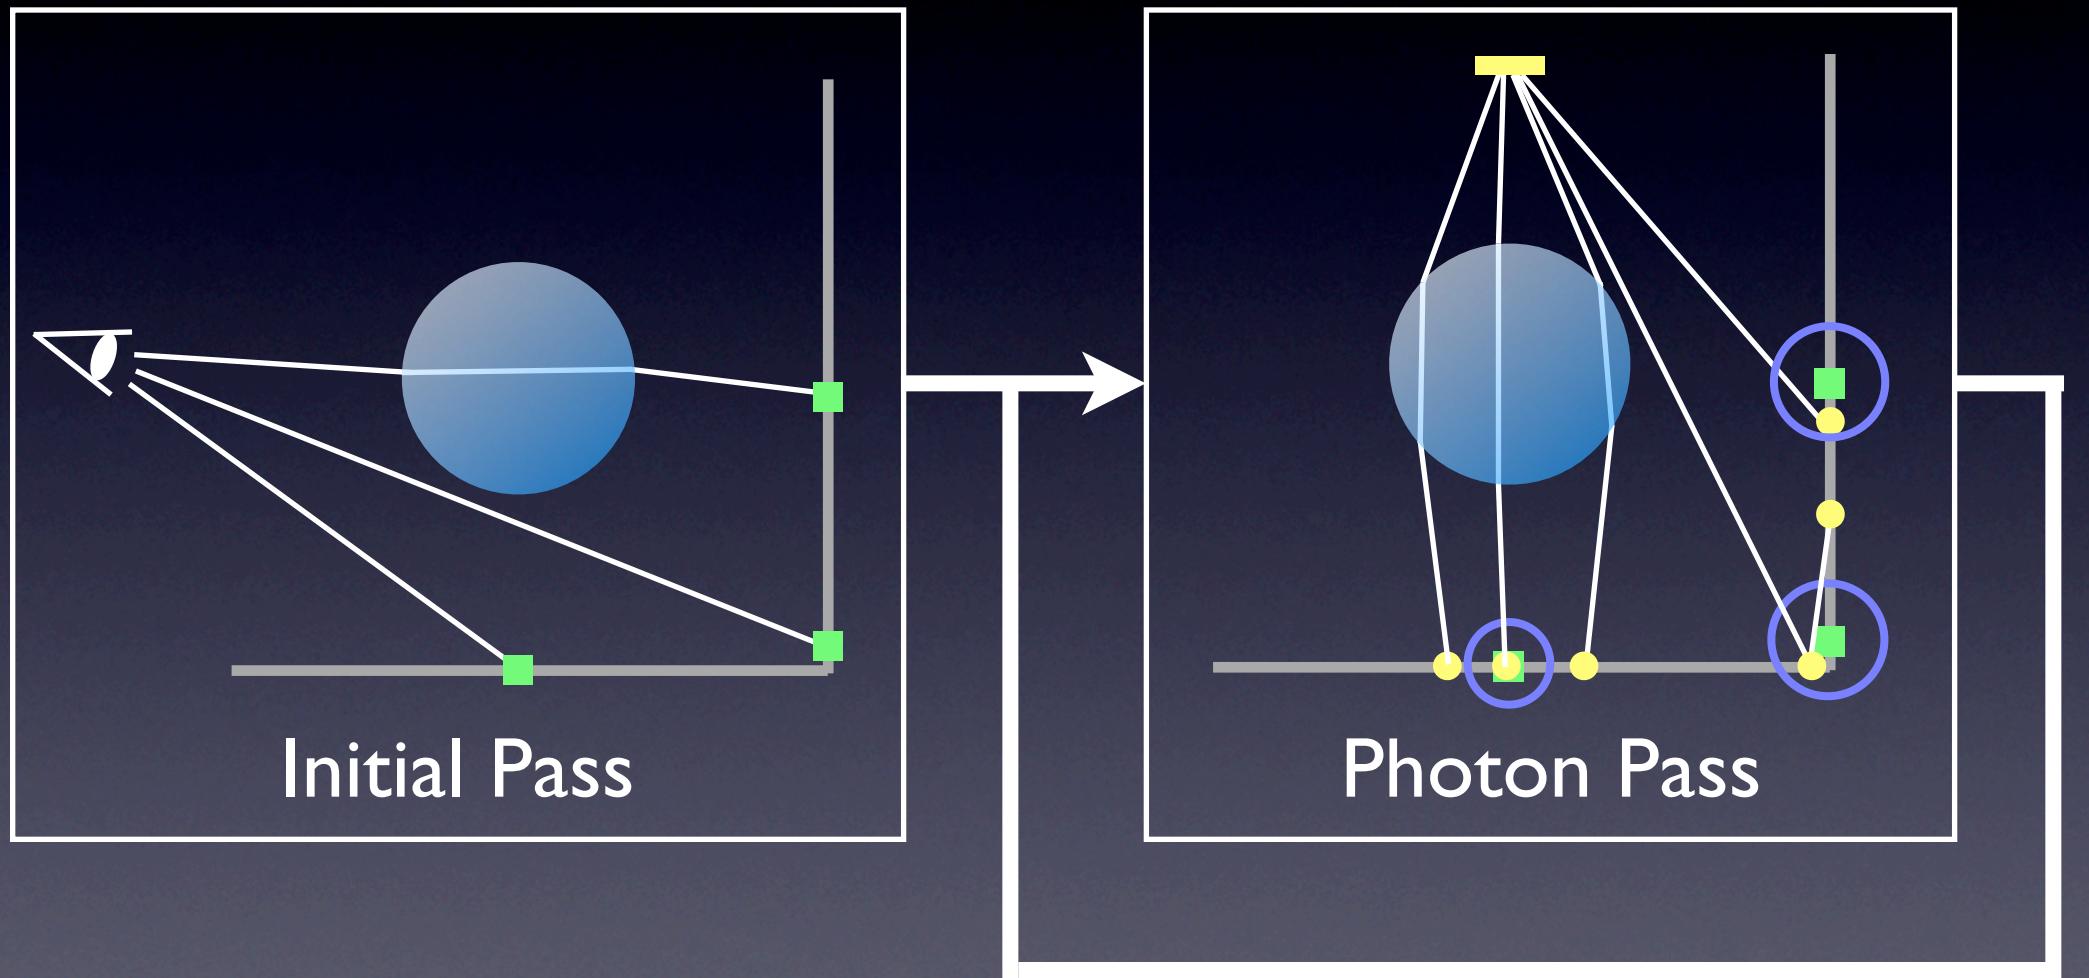

- Extension of progressive photon mapping
  - Consistent average radiance estimation
  - Can handle distributed ray tracing effects

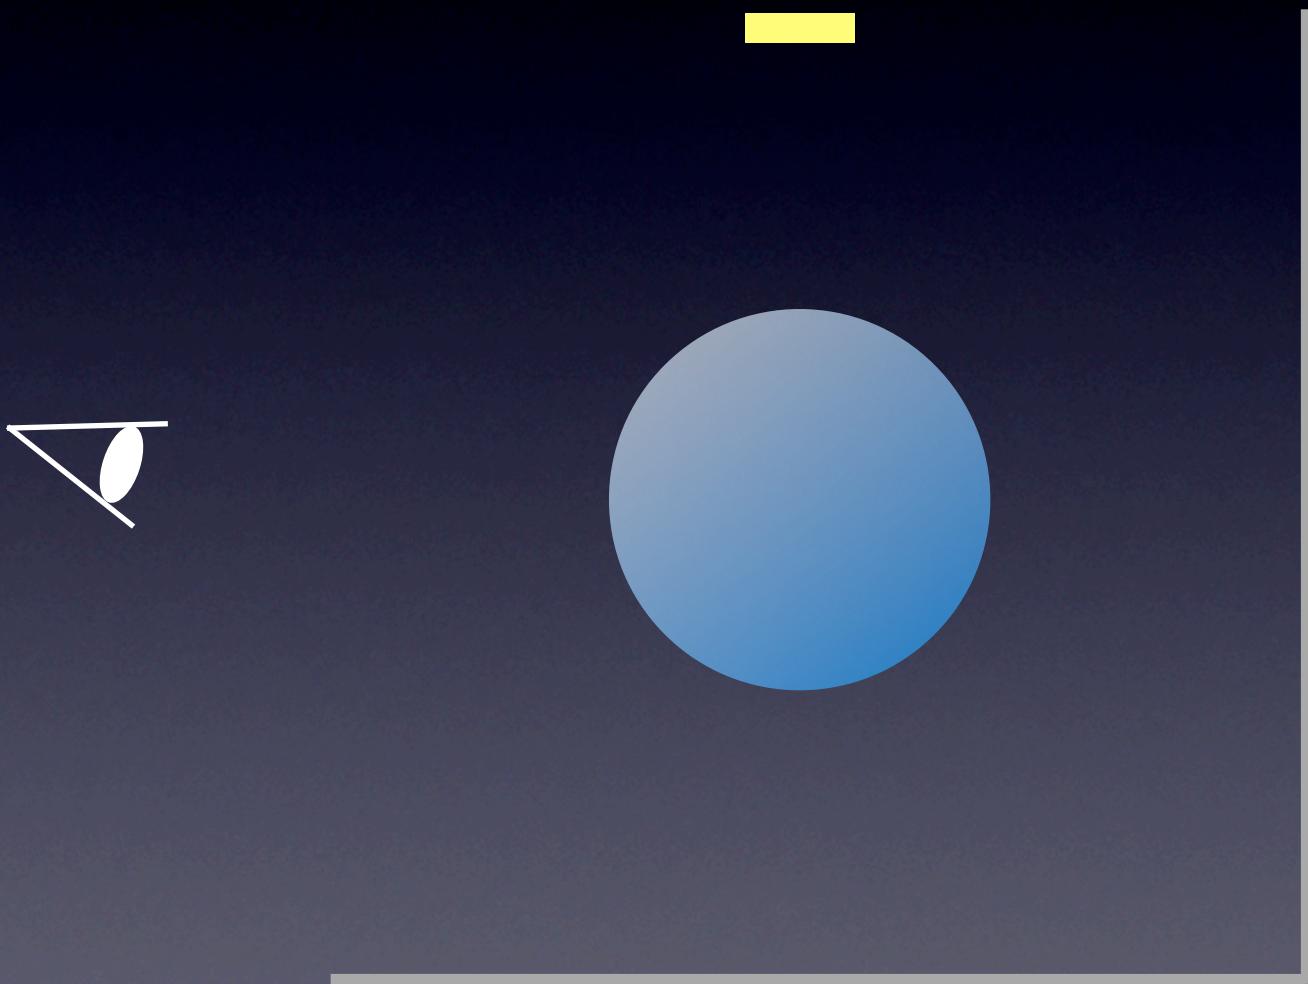

# Stochastic Progressive Photon Mapping

- Extension of progressive photon mapping
  - Consistent average radiance estimation
  - Can handle distributed ray tracing effects
  - Robust for *all* light path
  - Arbitrary accuracy using finite memory
  - Easy to implement

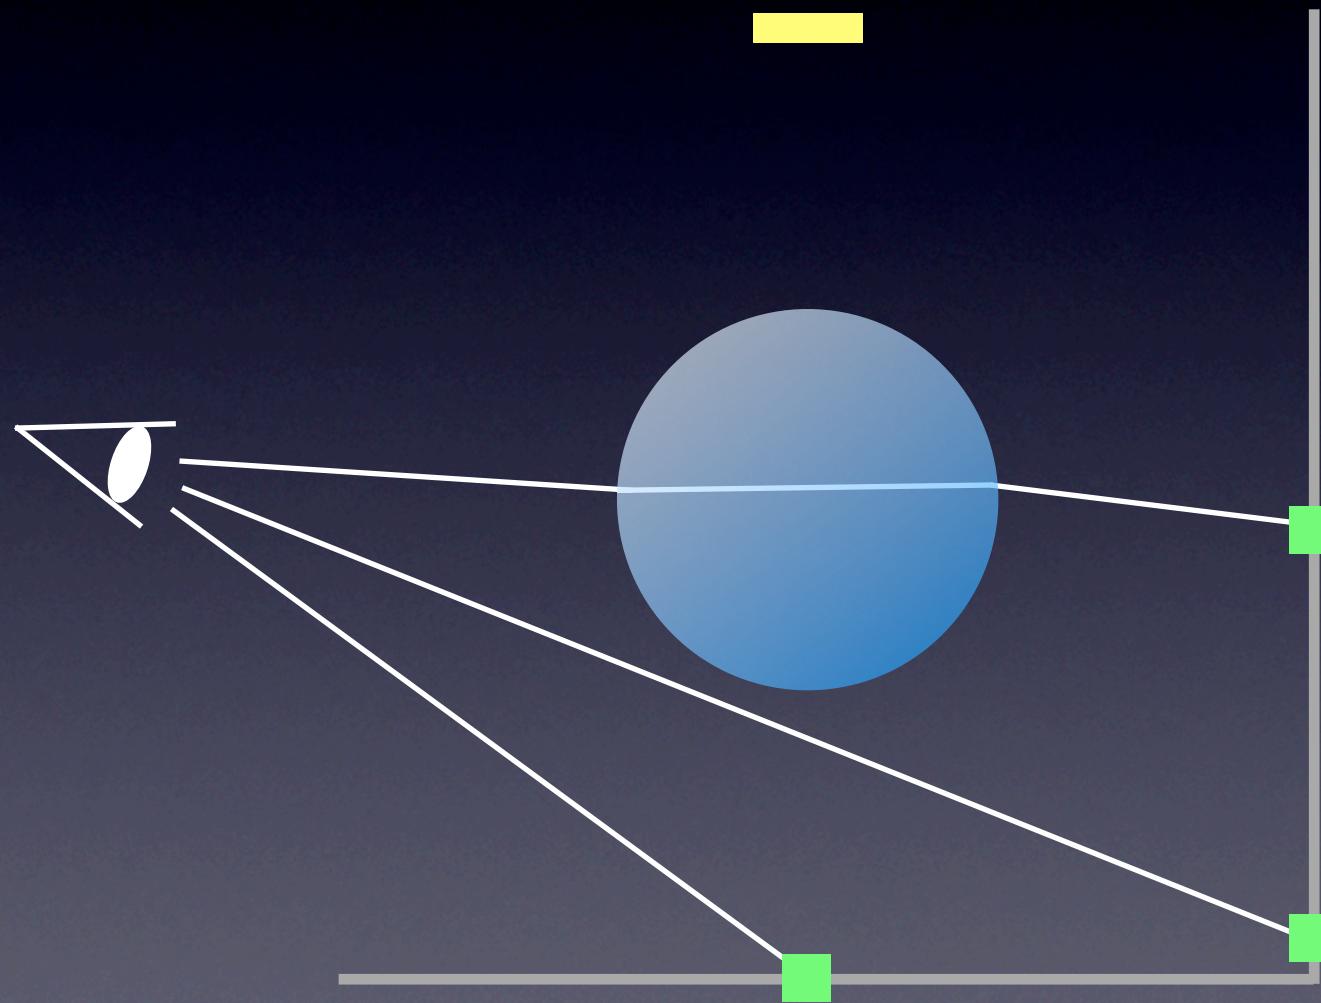

# Progressive Photon Mapping

# Overview

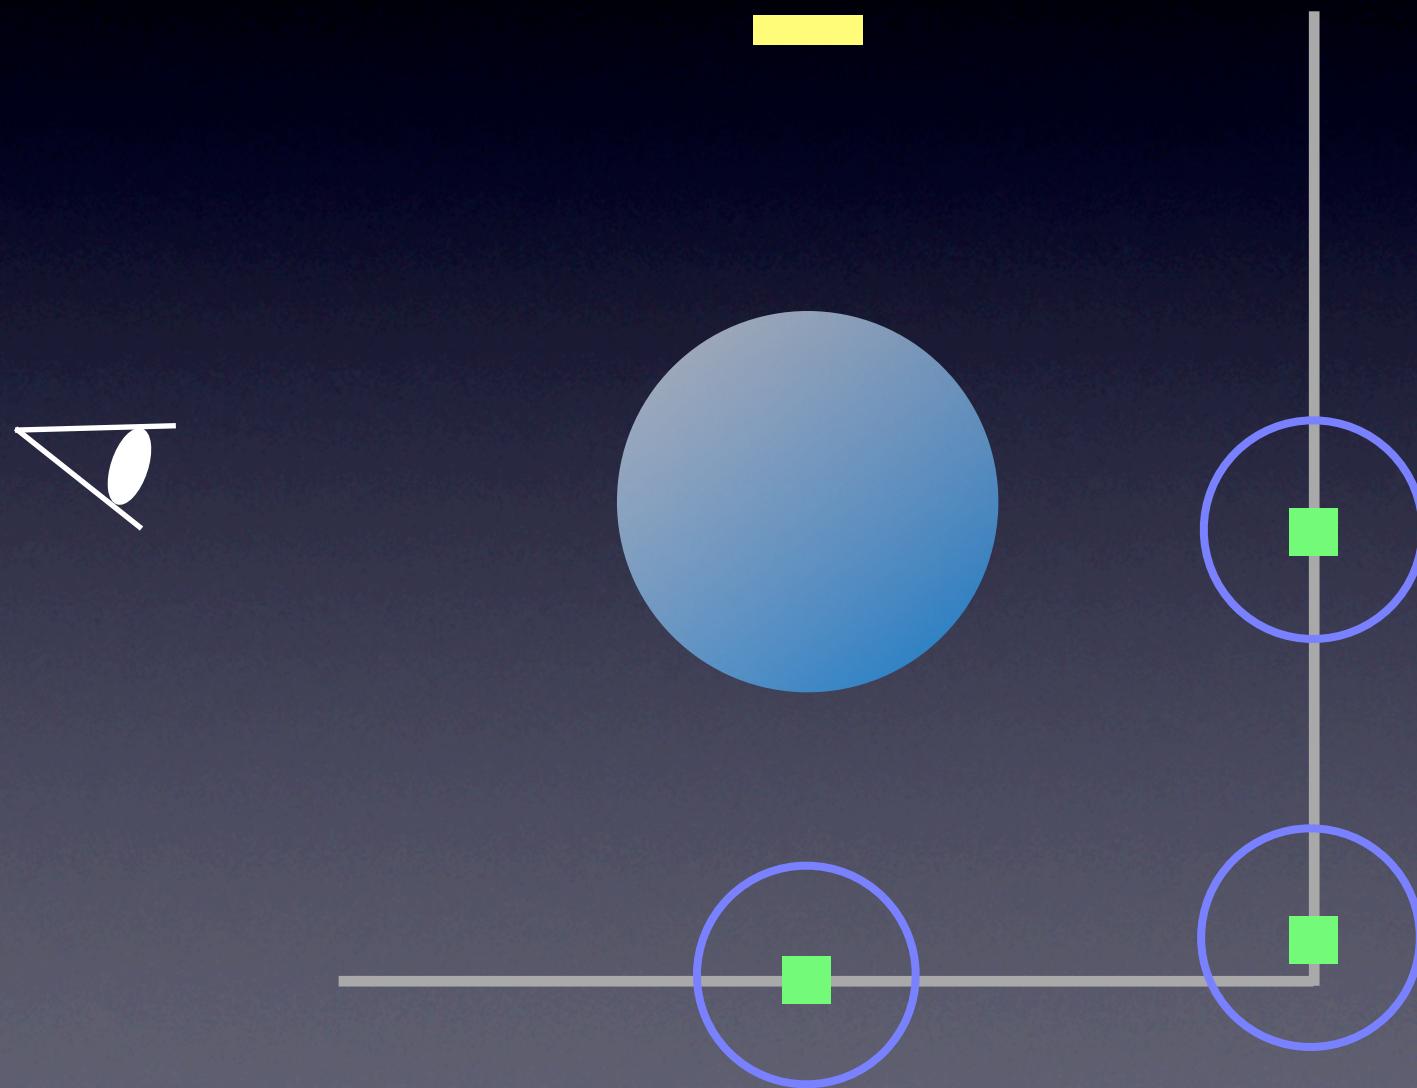

# Initial Pass

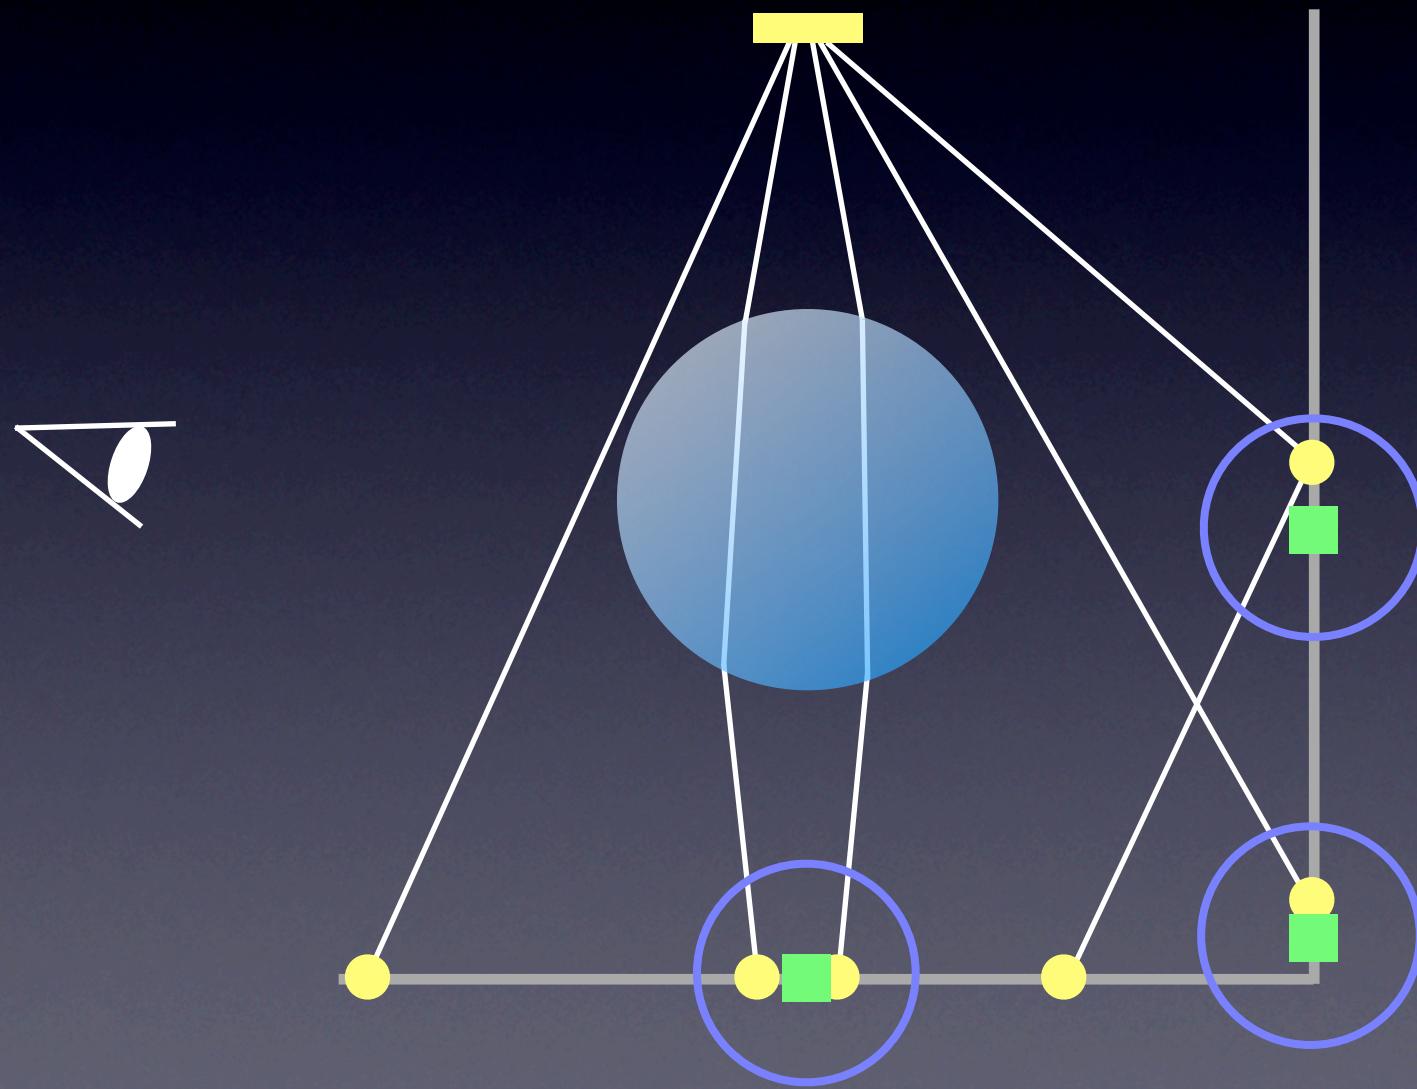

# Initial Pass

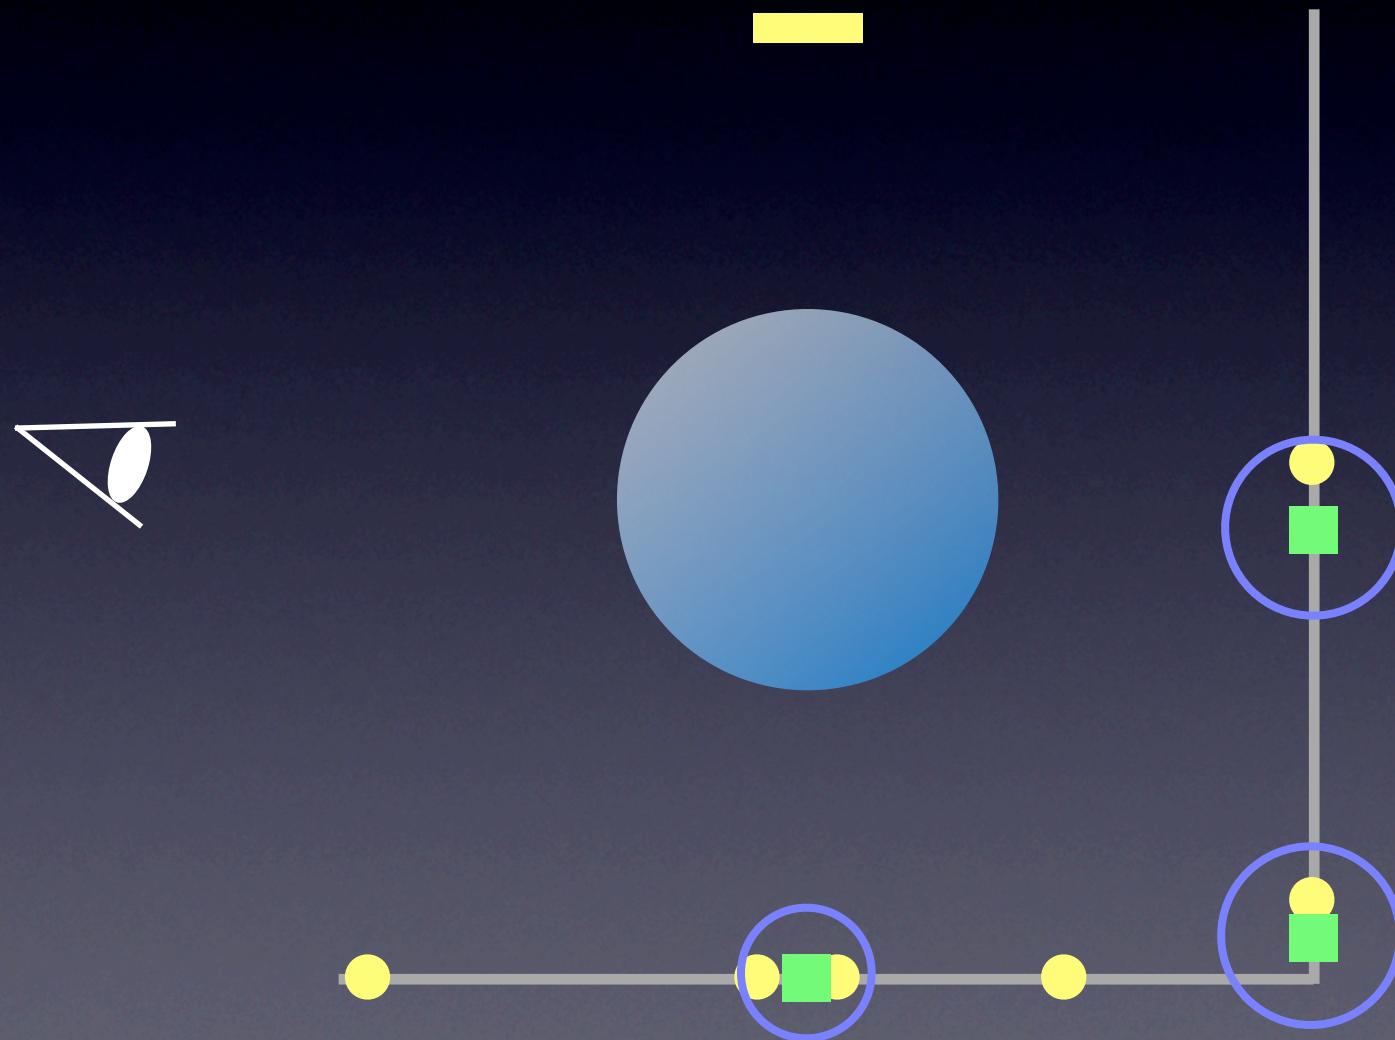

# Photon Statistics

- Per intersection point
  - Accumulated flux times BRDF  $\tau_i(x, \vec{\omega})$
  - Search radius  $R_i(x)$
  - Local photon count  $N_i(x)$
- Global
  - Emitted photon count  $N_e(i)$

# Next Photon Pass

# Rendering

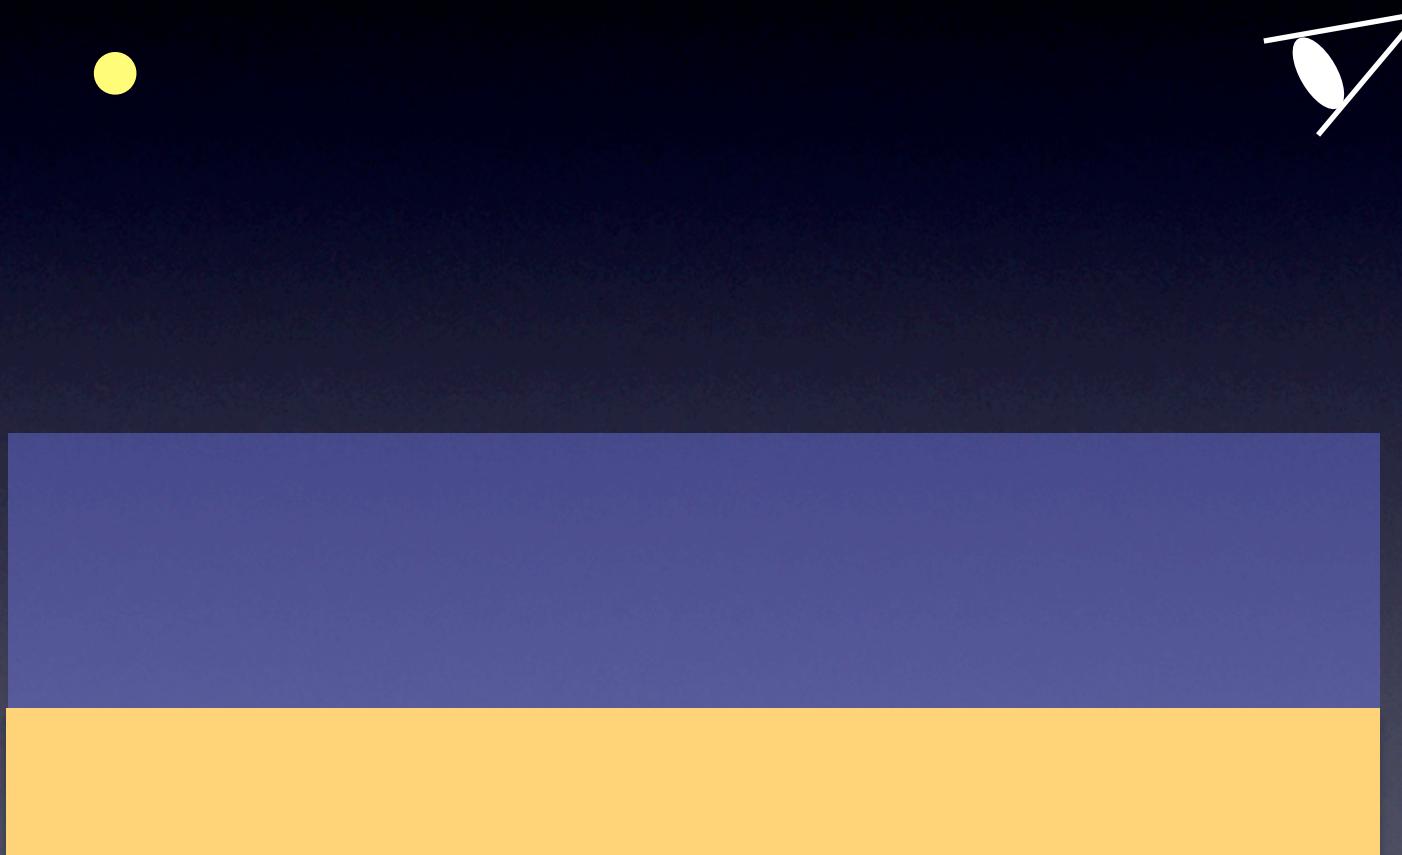

# Progressive Radiance Estimate

$$L_i(x, \vec{\omega}) = \frac{\tau_i(x, \vec{\omega})}{\pi R_i(x)^2 N_e(i)}$$

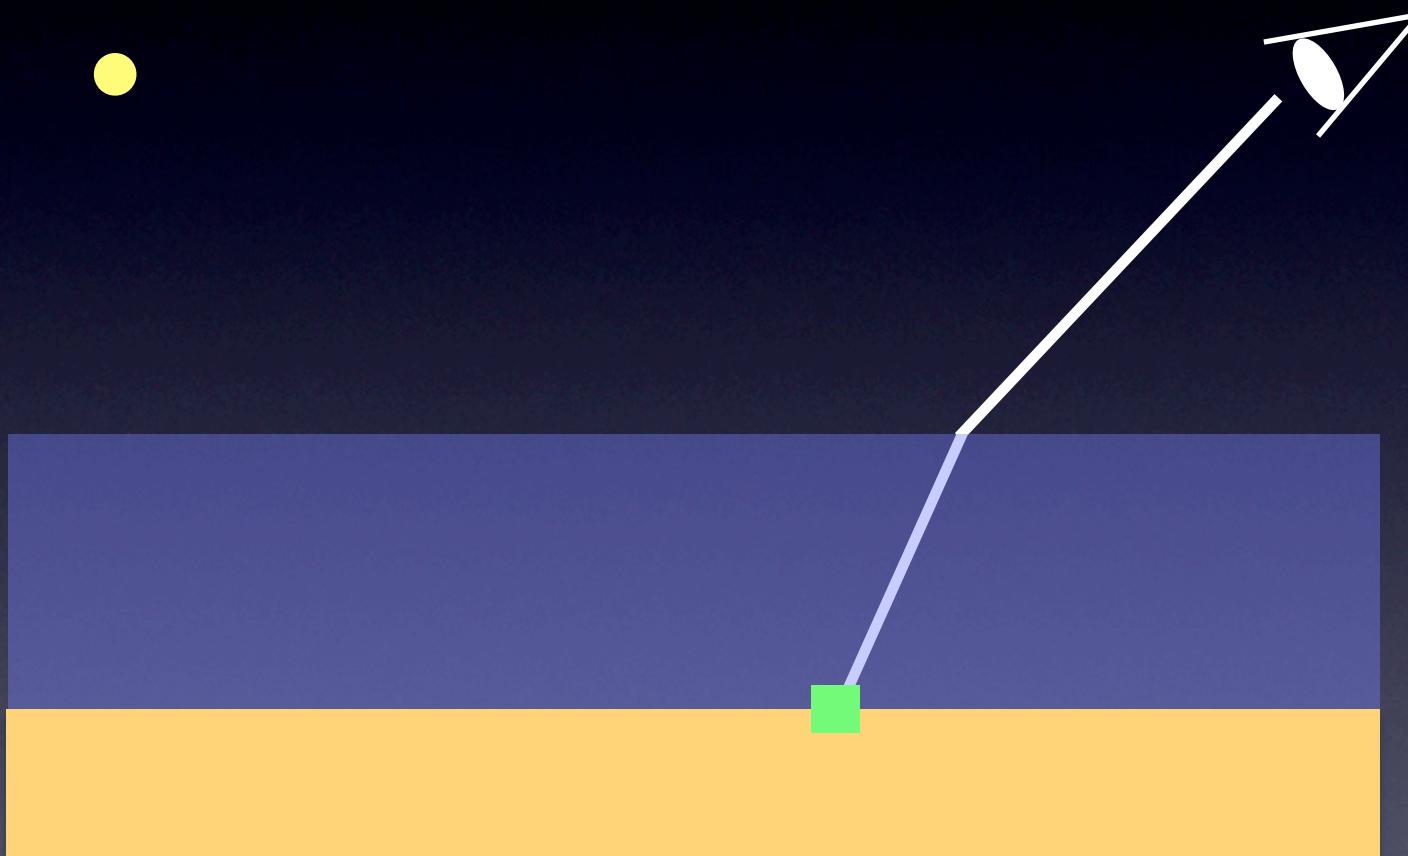

$$\lim_{i \rightarrow \infty} L_i(x, \vec{\omega}) = L(x, \vec{\omega})$$

# Stochastic Progressive Photon Mapping

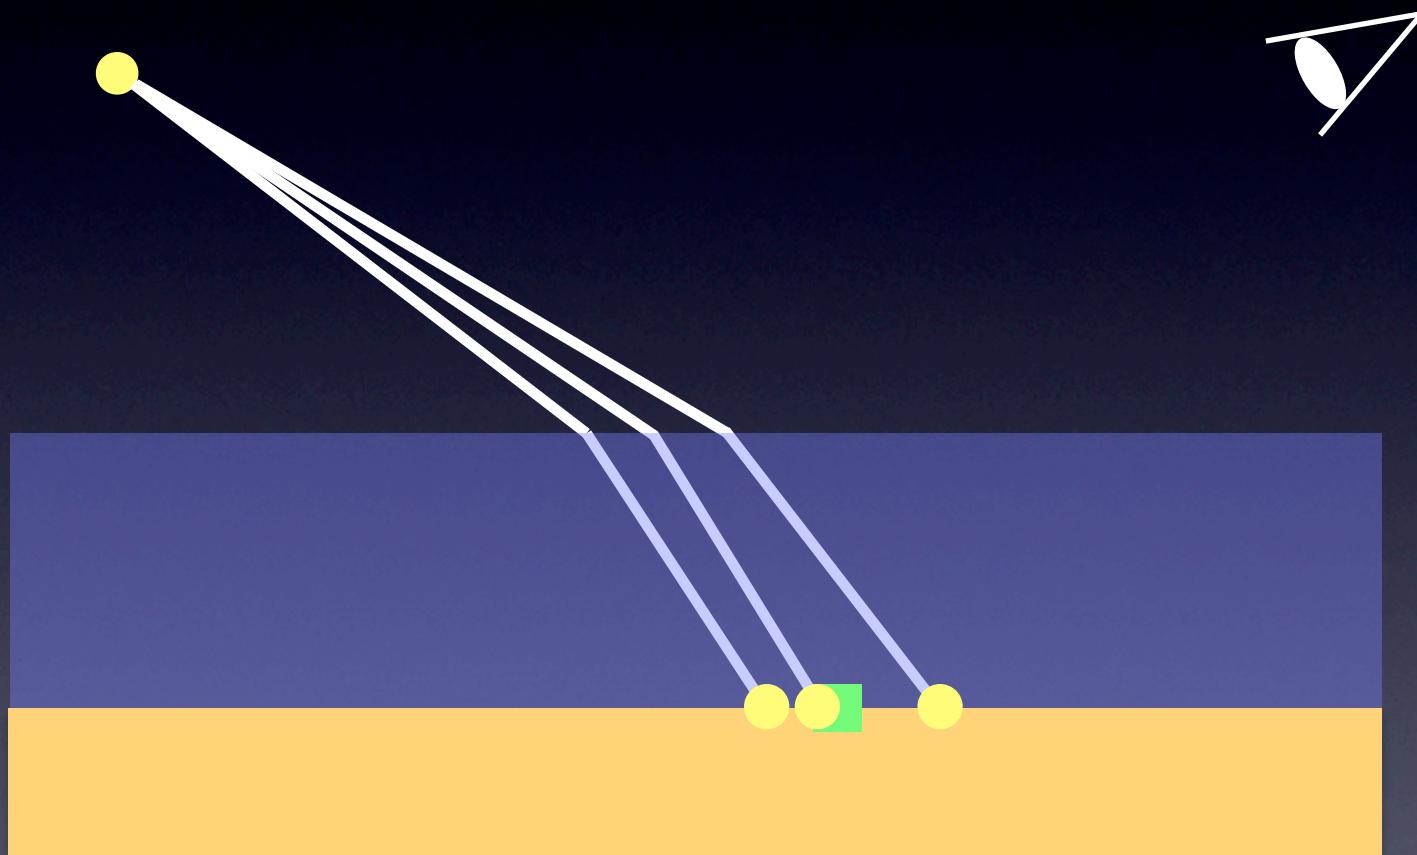

# Motivation

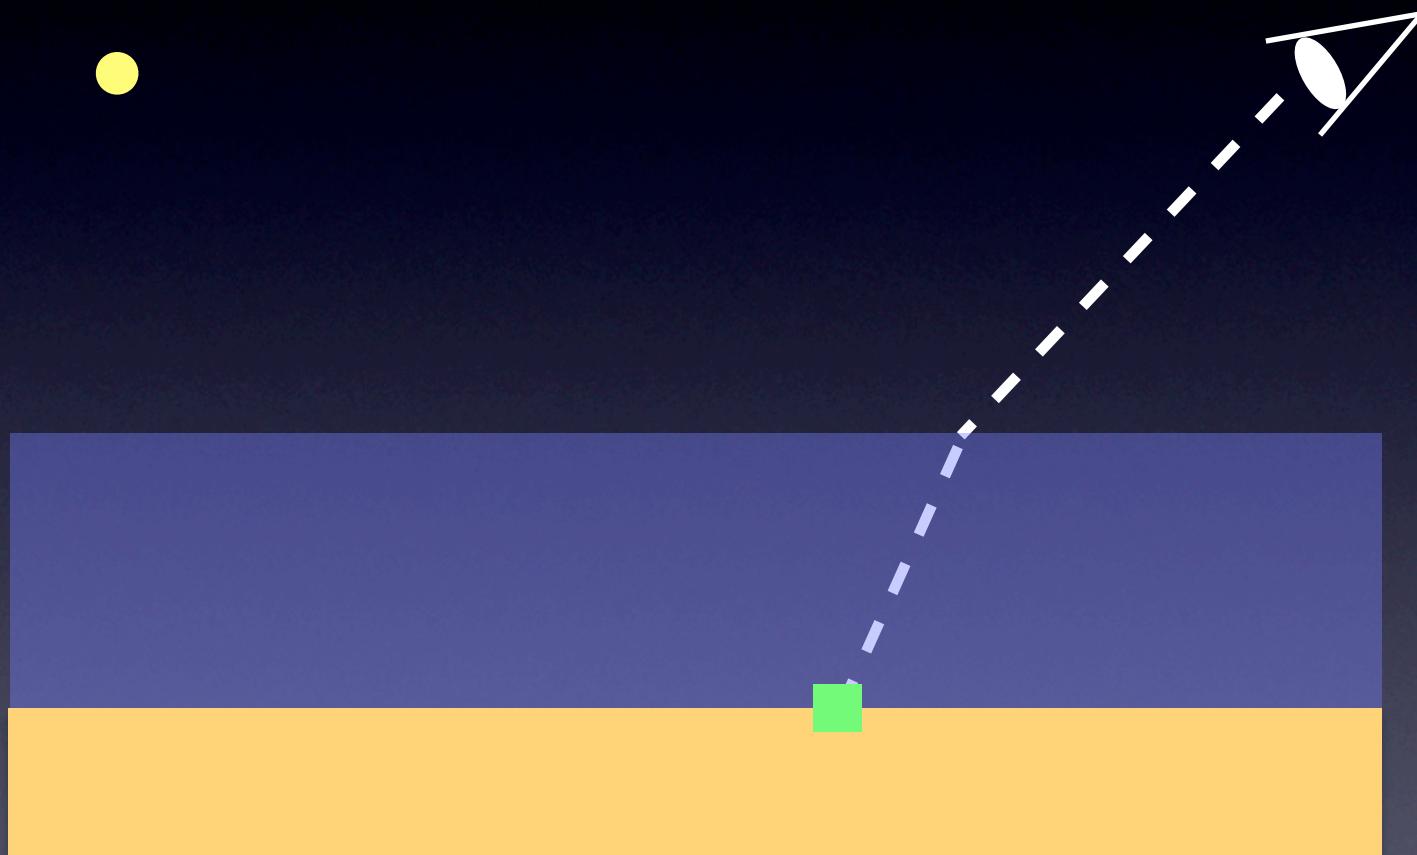

# Initial Pass

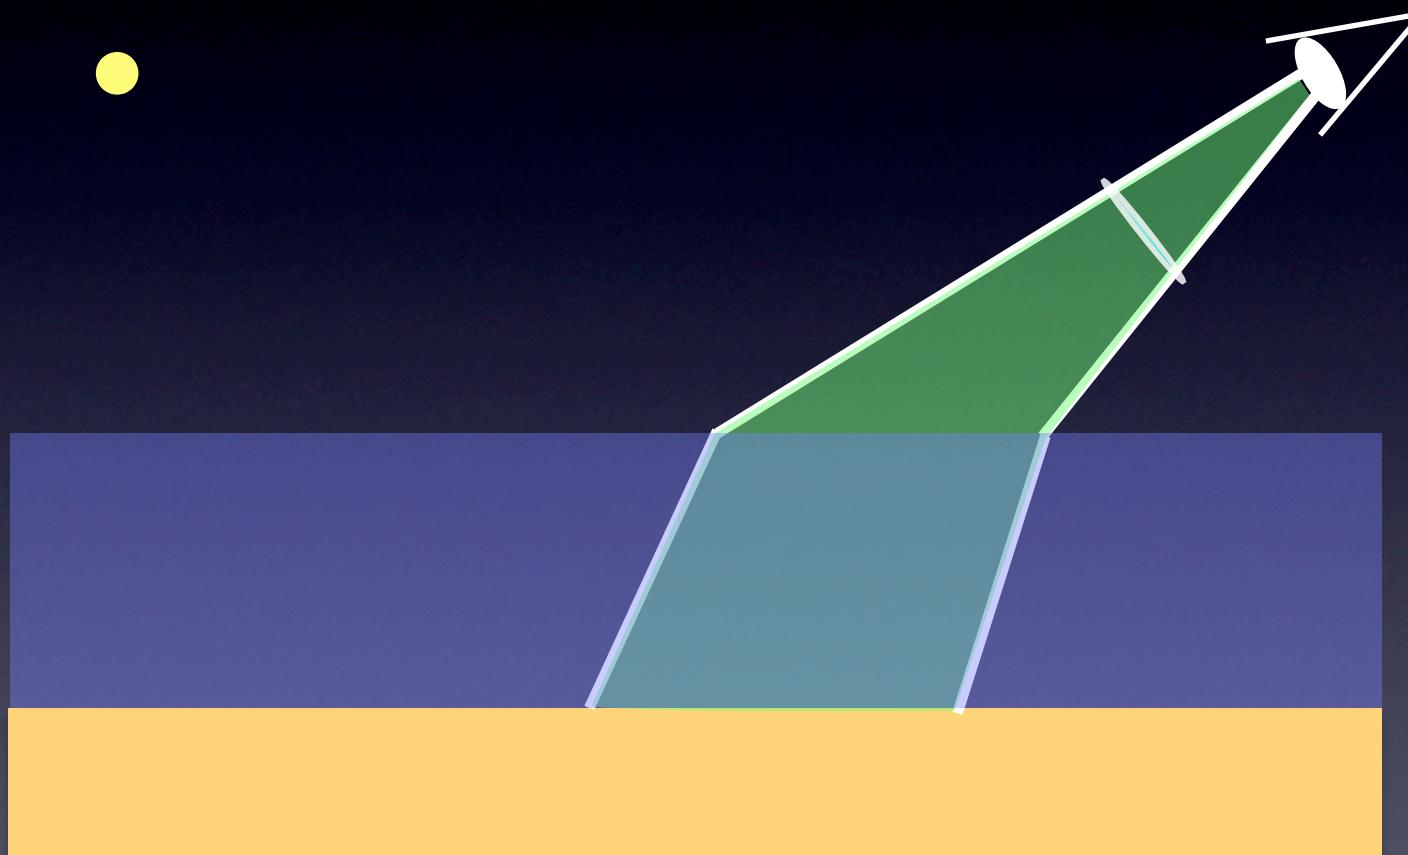

# Photon Pass

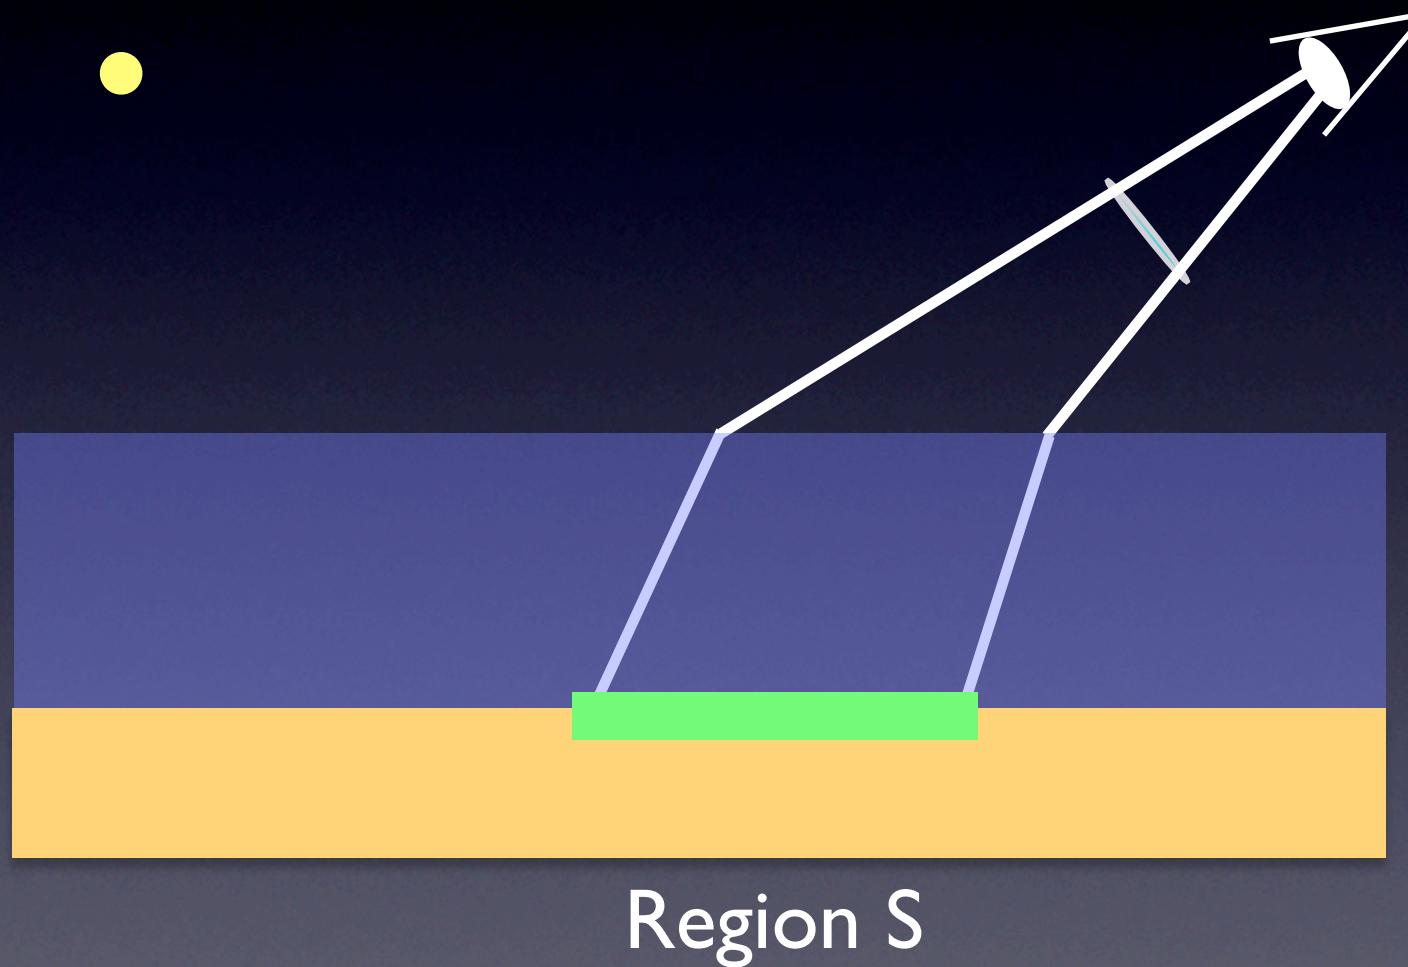

# Rendering

# Non-zero Aperture

# Non-zero Aperture

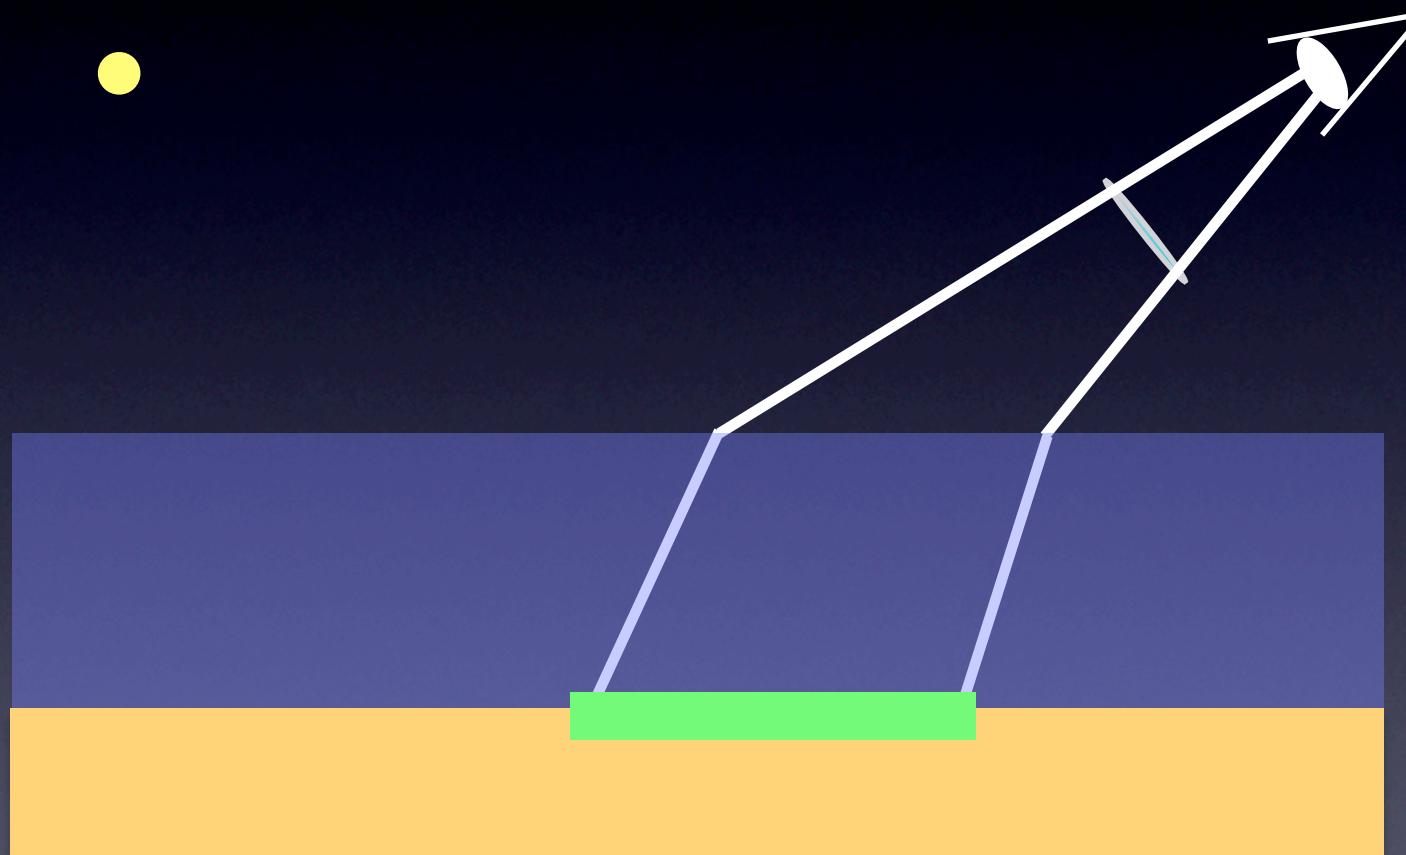

# Point-wise Radiance Estimate

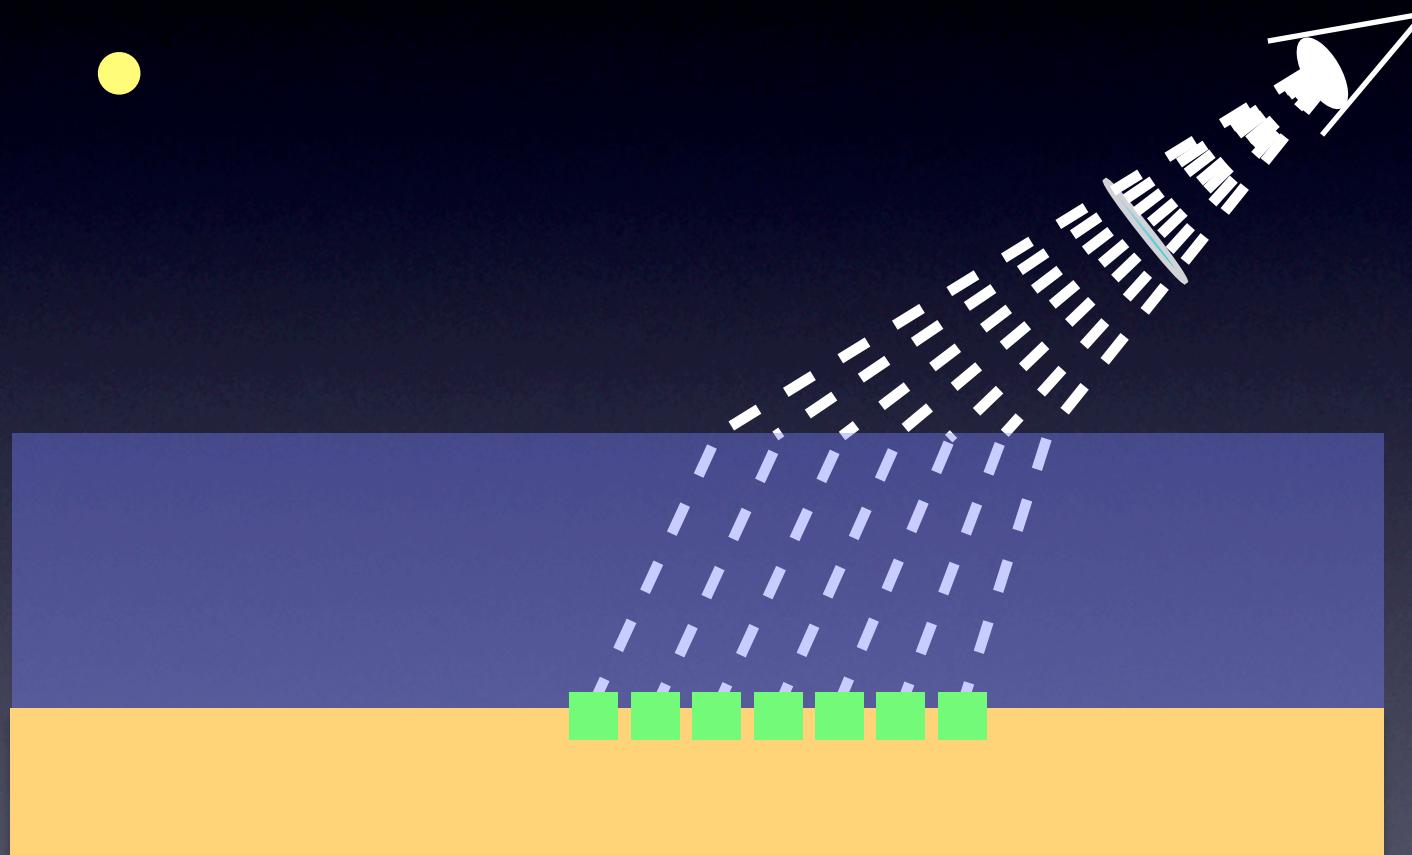

- Converges to the correct radiance at a point

$$\lim_{i \rightarrow \infty} L_i (\boxed{x}, \vec{\omega}) = L (\boxed{x}, \vec{\omega})$$

# Next Photon Pass

# Photon Statistics

- Per intersection point  $x$ 
  - Accumulated flux times BRDF  $\tau_i([x], \vec{\omega})$
  - Search radius  $R_i([x])$
  - Local photon count  $N_i([x])$
- Global
  - Emitted photon count  $N_e(i)$

# Average Photon Statistics

- Per region  $S$ 
  - Accumulated flux times BRDF  $\tau_i([S], \vec{\omega})$
  - Search radius  $R_i([S])$
  - Local photon count  $N_i([S])$
- Global
  - Emitted photon count  $N_e(i)$

# Progressive Radiance Estimate

$$L_i (\boxed{x}, \vec{\omega}) = \frac{\tau_i (\boxed{x}, \vec{\omega})}{\pi R_i (\boxed{x})^2 N_e(i)}$$

# Stochastic Progressive Radiance Estimate

$$L_i ([S], \vec{\omega}) = \frac{\tau_i ([S], \vec{\omega})}{\pi R_i ([S])^2 N_e(i)}$$

# Stochastic Progressive Radiance Estimate

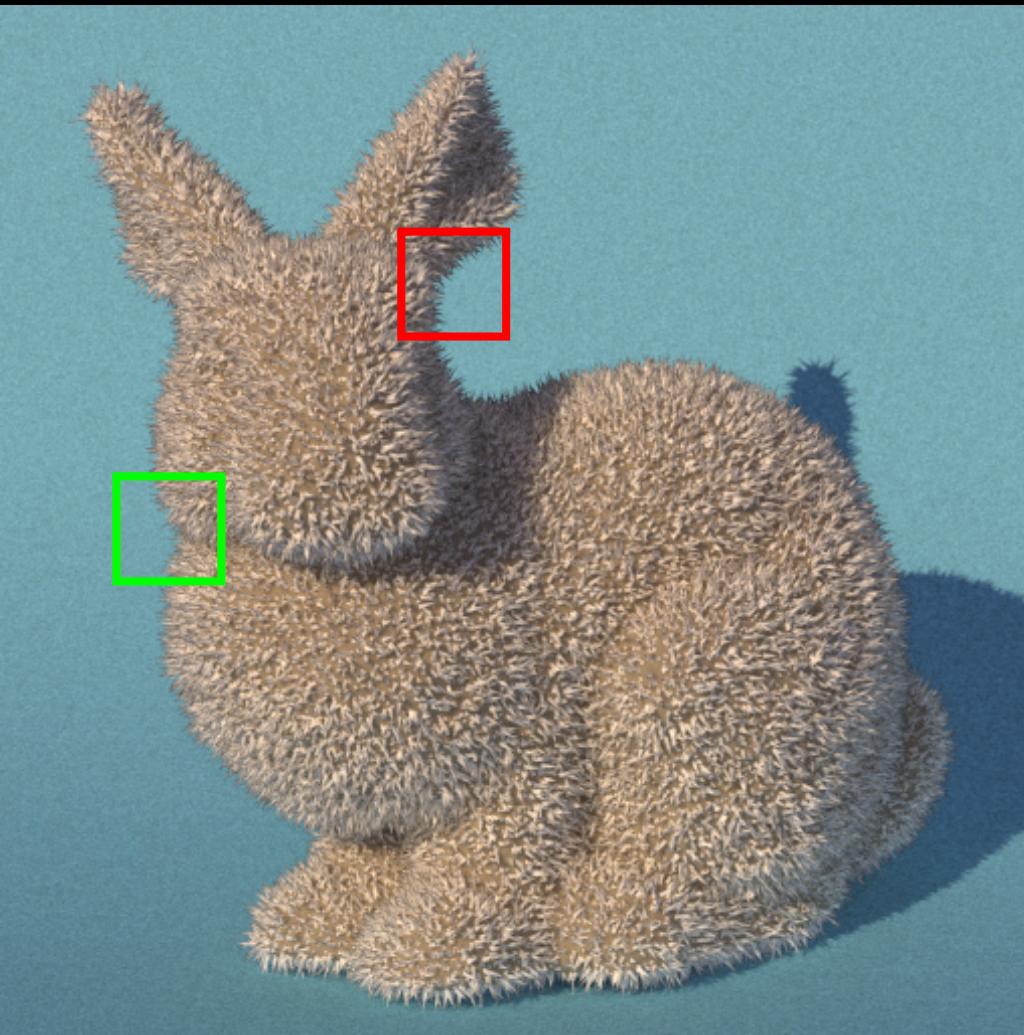

$$L_i(S, \vec{\omega}) = \frac{\tau_i(S, \vec{\omega})}{\pi R_i(S)^2 N_e(i)}$$

$$\lim_{i \rightarrow \infty} L_i(S, \vec{\omega}) = L(S, \vec{\omega})$$

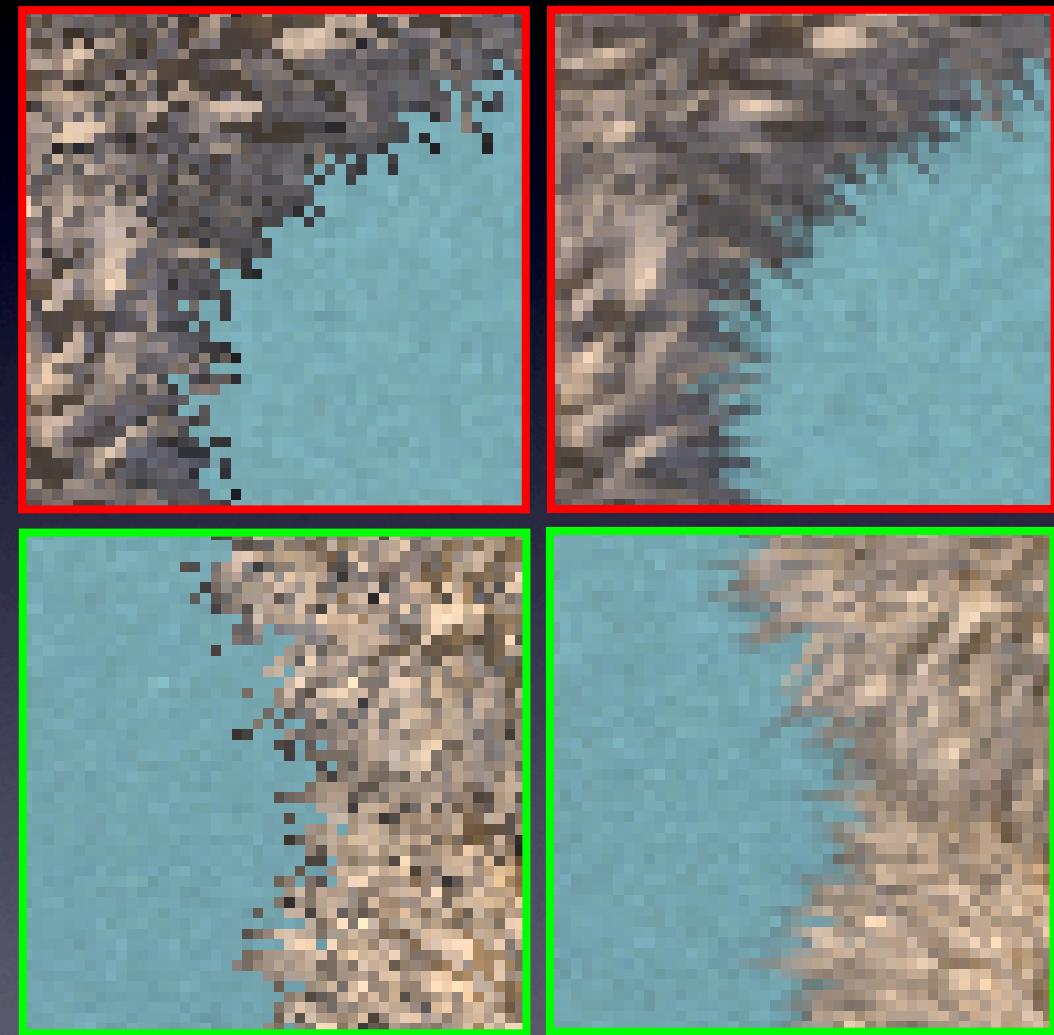

correct average radiance over S

# Conclusion

- Extension of progressive photon mapping
  - Consistent average radiance estimation
  - Can handle distributed ray tracing effects
  - Robust for *any* light path
  - Arbitrary accuracy using finite memory
  - Easy to implement
